

**AMENDMENTS TO THE SPECIFICATION:**

Please amend the paragraph beginning at page 3, lines 11-28, as follows:

~~Fig 2 Plot of mean temperature  $\pm$  1 standard deviation for condition 1 when no heat source is considered and the boundary conditions employed are constant surface temperature and constant surface heat flow~~ is a computer input/output screen graphical representation of the subsurface temperature obtained at various depths when surface temperature is constant and there is a constant surface heat flow and when there is no heat source. As depicted, for example, input boundary conditions are set such that the surface temperature,  $T_0 = 0^\circ\text{C}$ ; surface heat flow,  $Q_S = 80 \text{ mW/m}^2$ ,  $K = 3$  is the thermal conductivity of the surface; and  $CK = 0.4$  is the coefficient of variability in the thermal conductivity. Then, as also shown, at a depth of 2KM from the surface the determined mean temperature ( $t[i]$ ) is  $53.0^\circ\text{C}$ , upper bound temperature ( $tub[i]$ ) is  $69.0^\circ\text{C}$  and lower bound temperature is  $37.0^\circ\text{C}$ . The standard deviation is 16.0.

~~Fig 3 Plot of mean temperature  $\pm$  1 standard deviation for condition 2 when no heat source is considered and the boundary conditions employed are constant surface temperature and constant basal heat flow~~ is a computer input/output screen graphical representation of the subsurface temperature obtained at various depths when surface temperature is zero and there is a constant basal heat flow and when there is no heat source. For example, as shown, input boundary conditions are set so that surface temperature,  $T_0 = 0^\circ\text{C}$ ; basal heat flow,  $Q_B$  is  $30 \text{ mW/m}^2$ ,  $K$  is the thermal conductivity of the surface; and  $CK$  is the coefficient of variability in the thermal conductivity. Then, as shown, at a depth of 3KM from the surface the mean temperature ( $t[i]$ ) is  $45.0^\circ\text{C}$ , upper bound temperature ( $tub[i]$ ) is  $59.0^\circ\text{C}$  and lower bound temperature is  $31.0^\circ\text{C}$ . The standard deviation is 14.0.

~~Fig 4 Plot of mean temperature  $\pm$  1 standard deviation for condition 3 when a constant heat source is considered and the boundary conditions employed are constant surface~~

temperature and constant surface heat flow is a computer input/output screen graphical representation of the subsurface temperature obtained at various depths when surface temperature is constant and there is a constant surface heat flow and in the presence of a constant heat source. For example, as shown, input boundary conditions are set so that surface temperature,  $T_0 = 30^\circ\text{C}$ ; surface heat flow,  $Q_S$  is  $40 \text{ mW/m}^2$ ,  $K$  is the thermal conductivity of the surface;  $CK$  is the coefficient of variability in the thermal conductivity and  $A$  is the radiogenic heat source kept at  $2.5 \mu\text{W/m}^3$ . Then, as shown, at a depth of  $7.5 \text{ KM}$  from the surface the mean temperature ( $t[i]$ ) is  $106.0^\circ\text{C}$ , upper bound temperature ( $tub[i]$ ) is  $118.0^\circ\text{C}$  and lower bound temperature is  $94.0^\circ\text{C}$ . The standard deviation is  $12.0$ .

Fig 5 Plot of mean temperature  $\pm 1$  standard deviation for condition 4 when a constant heat source is considered and the boundary conditions employed are constant surface temperature and constant basal heat flow is a computer input/output screen graphical representation of the subsurface temperature obtained at various depths when surface temperature is constant and there is a constant basal heat flow and in the presence of constant heat source. For example, as shown, input boundary conditions are set so that surface temperature,  $T_0 = 30^\circ\text{C}$ ; basal heat flow,  $Q_B$  is  $20 \text{ mW/m}^2$ ,  $K$  is the thermal conductivity of the surface;  $CK$  is the coefficient of variability in the thermal conductivity and  $A$  is the radiogenic heat source kept at  $2.5 \mu\text{W/m}^3$ . Then, as shown at a depth of  $7.5 \text{ KM}$  from the surface the mean temperature ( $t[i]$ ) is  $119.0^\circ\text{C}$ , upper bound temperature ( $tub[i]$ ) is  $145.0^\circ\text{C}$  and lower bound temperature is  $93.0^\circ\text{C}$ . The standard deviation is  $26.0$ .

Fig 6 Plot of mean temperature  $\pm 1$  standard deviation for condition 5 when an exponential heat source is considered and the boundary conditions employed are constant surface temperature and constant surface heat flow is a computer input/output screen graphical representation of the subsurface temperature obtained at various depths when surface

temperature is constant and there is a constant surface heat flow and when an exponential heat source is considered. For example, as shown, input boundary conditions are set so that surface temperature,  $T_0 = 30^\circ\text{C}$ ; surface heat flow,  $Q_S$  is  $43 \text{ mW/m}^2$ ,  $K$  is the thermal conductivity of the surface;  $CK$  is the coefficient of variability in the thermal conductivity and  $A$  is the radiogenic heat source kept at  $2.6 \mu\text{W/m}^3$ . Then, as shown at a depth of  $35.0 \text{ KM}$  from the surface the mean temperature ( $t[i]$ ) is  $285.0^\circ\text{C}$ , upper bound temperature ( $tub[i]$ ) is  $345.0^\circ\text{C}$  and lower bound temperature is  $225.0^\circ\text{C}$ . The standard deviation is  $60.0$ .

Fig 7 Plot of mean temperature  $\pm 1$  standard deviation for condition 6 when an exponential heat source is considered and the boundary conditions employed are constant surface temperature and constant basal heat flow is a computer input/output screen graphical representation of the subsurface temperature obtained at various depths when surface temperature is constant and there is a constant basal heat flow and when an exponential heat source is considered. For example, as shown, input boundary conditions are set so that the surface temperature,  $T_0 = 0^\circ\text{C}$ ; basal heat flow,  $Q_B$  is  $20 \text{ mW/m}^2$ ,  $K$  is the thermal conductivity of the surface;  $CK$  is the coefficient of variability in the thermal conductivity and  $A$  is the radiogenic heat source kept at  $2.2 \mu\text{W/m}^3$ . Then, as shown at a depth of  $35 \text{ KM}$  from the surface the mean temperature ( $t[i]$ ) is  $342.0^\circ\text{C}$ , upper bound temperature ( $tub[i]$ ) is  $398.0^\circ\text{C}$  and lower bound temperature is  $286.0^\circ\text{C}$ . The standard deviation is  $56.0$ .
